When I try to download a file from the Internet, Internet Explorer displays the message: "Your Web site has been blocked by Windows Internet Explorer. Web sites that are not in the Windows Internet Zone cannot be opened in Internet Explorer". Internet Explorer runs as an active Internet firewall. In addition, it can control the access to Internet resources. Internet Explorer works with a central server, Microsoft Edge, on Windows 10. Each PC, and its connected devices, have their own password, called a network password. When you open Internet Explorer, the program generates a unique password for you. It uses the same password that you use for the corresponding computer. This password is stored in the central server. If a connection with the central server is lost, Internet Explorer cannot access the Internet. If you wish to see whether the problem is in Internet Explorer, you can configure Internet Explorer to use a new network password. You can also configure Internet Explorer to use the computer's login password to access the Internet. This approach is used to bypass Internet Explorer's filter and to display a site in your browser. If you want to allow Internet Explorer to use the computer's login password to access the Internet, you should be aware that your login password is stored in Internet Explorer's temporary Internet files. If you have a large number of cookies, Internet Explorer can delete temporary Internet files. This operation can take a long time. Internet Explorer runs as an Internet firewall. It cannot access the Internet and cannot configure other network devices. Other network devices can read

cookies. Internet Explorer sends cookies to all websites. The data in the cookies are sent in the address bar. Internet Explorer stores your password. If you receive a warning on the website that says that your password has been stored on the Internet, then this information is correct. Internet Explorer stores your password to allow you to access Internet sites that cannot be viewed in your browser. Internet Explorer stores your password for only a limited period of time. The data can remain on the Internet for weeks. If you want to see whether the problem is Internet Explorer, you should configure Internet Explorer to use a new network password. If you use Internet Explorer to access a website that contains confidential information, you should change your Internet Explorer's network password after each visit. You can change your network password by right-clicking on Internet
